

#Author: Winfield, Date: 01/28/2025, Purpose: Descriptive measures functions

Calculate standard deviation

Create dummy dataset

data <- c(1,2,3,4,5,6,7,8)

data1 <- c("A", "B", "C")

data2 <- c(1:1000)

sd(data)

#[1] 2.44949

sd(data2)

#[1] 288.8194

Calculate mean

mean(data)

#[1] 4.5

Calculate median

median(data)

[1] 4.5

Calculate mode in R

getmode <- function(v) {

 uniqv <- unique(v)

 uniqv[which.max(tabulate(match(v, uniqv)))]}

data4 <- c(1,2,1,3,4,5)
